"Characterization of the Citrobacter freundii phoE gene and development of C. freundii-specific oligonucleotides.";

FEMS Microbiol. Lett. 78:199-204(1992).

1- FUNCTION: THIS IS ONE OF THE PROTEINS INDUCED WHEN CELLS ARE GROWN UNDER PHOSPHATE LIMITATION. ITS PROTEIN PORE IS PARTICULARLY EFFICIENT IN THE UPTAKE OF INORGANIC PHOSPHATE, PHOSPHORYLATED COMPOUNDS, AND SOME OTHER NEGATIVELY CHARGED
                                                                                                                       the European Bloinformatics Institute.     No. 1s the number of results predicted by chance to have a
re greater than or equal to the score of the result being printed,
is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      seq

Pred. No. score grea and is No. is the number of results predicted by chance to have a greater than or equal to the score of the result being printed, s derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CC The polypeptide monomer is a variant based on a consensus sequence cc derived from the fibre forming regions of spider dragline protein, CC esp. the natural protein 1 (Spideroin 1) from Nephila clavipes.

CC DNA sequence encoding the monomer may be used in the recombinant cc production of the variant protein in a recombinant host, e.g. E. coli cor Bacillus subtilis. Synthetic analogues of DP1 were designed to minic cc or trepeating consensus sequence of the natural protein and the pattern cc of variation among individual repeats. DP-1A analogues are composed co fa tandemly repeated 101 amino acid monomer which comprises four crepeats which differ from the consensus sequence given in AAM06201, CC according to the pattern (1)-(5) given below. This 101 amino acid monomer is repeated 1-16 times in a series of analogue proteins. The cc individual repeats differ from the consensus according to the pattern: (2) when the entire poly-alanine sequence is deleted, co also is the surrounding sequence varies in length from 0-7 cc (3) aside from the poly-alanine sequence, deletions usually cc (4) deletion of GVG is generally accompanied by deletion of GRG coleted is generally preceded by a repeat containing six alanine sequence is coleted is generally preceded by a repeat containing six alanine.

The protein improves the moisturizing/ softening action of the compositions. The protein, and its fragments are used in cosmetic or dermatological compositions. These compositions have use as hair or skin care products; and make-up or sunscreens. As the protein is a good, persistent film-formers on the skin of low surface density, it can be used for delivery of active agents that are generally difficult to administer, e.g. vitamins,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ş
                                                                                                                                                                                                                                                              CC A process has been developed for the production of a DNA fragment CC encoding silk protein. The process involves: (a) selecting target DNA, CC from a silk-producing spider, that contains many repetitive and non-cC repetitive regions; (b) selecting a single-stranded DNA primer of at CC least 10 nucleotides with a sequence that is complementary to a region CC of the target; (c) repetitively combining the primer with melted target CC DNA, incubating the mixture with nucleotides and a DNA polymerase with CC proofreading activity to produce a DNA fragment which is complementary CC to the target and is at least 2 kb long. The present sequence encodes the spider silk protein from Nephila clavipes. The DNA fragment can be used to make fibres, films, woven articles, e.g. for use in parachites, CC used to make fibres, films, woven articles, e.g. for use in parachites, cails, body armour, and absorbers (e.g. of heavy metals, biological CC weapons, DNA, chemicals, flavours and fragrances). The high molecular CC weight (90-250 kD) of spider silk proteins can be produced on a CC commercial scale (at over 2 g/1 cell mass). It has better tensile compared the content of both repetitive regions ensures isolation of stable clones.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           밁
The present sequence represents the natural spider silk protein spidroine major 1. The protein improves the moisturizing/softening action of the compositions. The protein, and its fragments are used in cosmetic or dermatological compositions. These compositions have use as hair or skin care products; and make-up or sunscreens. As the protein is a good, persistent film-formers on the skin
                                                                                                                                                                                          Claim 3; Fig 1; 32pp; French.

Spider silk proteins, and peptide fragments within the proteins, can be produced and purified independently and can then be mixed and made into fibres that have higher tensile strengths and elasticity than naturally occurring fibres. The fibres can be used in mixed composites. The invention allows the two naturally occurring wephila clavipes silk proteins to be produced independently so that they can later be combined to form silk fibres of high tensile strength
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       proteins. The spider silk proteins are characterized by repeating alpha and beta regions and optional variable regions. The DNA sequences are useful in the production of spider silk protein by a combinant DNA techniques. The recombinant spider silk proteins may be used for the production of fibers. The present sequence represents the spider silk protein 1, derived from the major ampullate gland of Nephila clavipes.

The repeat itself contains 3 regions. The first comprises 0-9 amino acids with a sequence ARG(GSX)2. This region is not highly conserved. The second region has a sequence GAG(A)x which is highly conserved and is 8-10 amino acids long. The third segment is (GGX)2 and is 15 amino acids long and is very highly conserved. In most cases X is A,O, Y or L. Removal of the poly-(Ala) segments results in a silk having lower elasticity.

13;

Spider dragline variant, DP-1B.16 polymer.

17-JAN-1997 AAR99057;

(first entry)

```
derived from the fibre forming regions of spider dragiline protein,
cesp. the natural protein 1 (Spidroin 1) from Nephila clavipes. The
CDNA sequence encoding the monomer may be used in the recombinant
CC DNA sequence encoding the monomer may be used in the recombinant
CC or Bacillus subtilis. Synthetic analogues of DP1 were designed to mimic
CC or Bacillus subtilis. Synthetic analogues of DP1 were designed to mimic
CC the repeating consensus sequence of the natural protein and the pattern
CC the natural sequence which is not shared by DP-1A, namely that a repeat
CC the natural sequence which is not shared by DP-1A, namely that a repeat
CC the natural sequence which is not shared by DP-1A, namely that a repeat
CC the sequence of DP-1B matches the natural sequence more closely over
CC a more extended segment than does DP-1A.
CC The sequence of DP-1B matches the natural sequence more closely over
CC a more extended segment than does DP-1A.
CC (1) the poly-alanine sequence varies in length from 0-7
CC (1) the poly-alanine sequence varies in length from 0-7

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           밁
This sequence represents a synthetic spider dragline variant polymer, pp-1B.9. The sequence of the DP-1B.9 monomer is given in AAR99054. The polypeptide monomer is a variant based on a consensus sequence derived from the fibre forming regions of spider dragline protein, esp. the natural protein 1 (Spidroin 1) from Nephila clavipes. The DNA sequence encoding the monomer may be used in the recombinant production of the variant protein in a recombinant host, e.g. E. coli or Bacillus subtilis. Synthetic analogues of DP1 were designed to mimic the repeating consensus sequence of the natural protein and the pattern of variation among individual repeats. This monomer exhibits all of the regularities of (1)-(5) below. In addition, it exhibits a regularity of the natural sequence which is not shared by DP-1A, namely that a repeat in which both GYG and GRG are deleted is generally preceded by a repeat.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Spider; dragline protein; variant; monomer; polymer; fibre forming region; Spidroin 1; Nephila clavipes; DP1; mimic; DP-1A analogue; fibre; high tensile strength; elasticity; clothing; rope; surgical suture; implant; reinforcement; film; coating.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New synthetic variants of spider dragline protein - for making fibres useful as clothing, surgical silk, plastic reinforcement etc., also related DNA, vectors and transformed cells

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequence of DP-1B matches the natural sequence more closely over a more extended segment than does DP-1A. The individual repeats differ from the consensus sequence given in ARMOG2D1 according to the pattern:

(1) the poly-alanine sequence varies in length from 0-7 residues; (2) when the entire poly-alanine sequence is deleted, so also is the surrounding sequence encompassing ARRGGLGGGARANGG; (3) aside from the poly-alanine sequence, deletions usually encompass integral multiples of three consecutive residues; (4) deletion of GYG is generally accompanied by deletion of GRG in the same sequence; and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The proteins may be used to produce fibres of high tensile strength and elasticity, suitable for clothing, rope, surgical sutures, biomaterials for implants, plastic reinforcements, films, coatings, etc.
                                                                                                                                                                                                                             Spider silk protein; spidroine major 1; dermatological compositions; hair care;

The protein improves the moisturizing/softening action of the compositions. The protein, and its fragments are used in cosmetic or dermatological compositions. These compositions have use as hair or skin care products; and make up or sunscreens. As the protein is a good, persistent film-formers on the skin of low surface density, it can be used for delivery of active agents that are generally difficult to administer, e.g. vitamins, hormones, moisturizers or agents for treating disorders of the

                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents a polymer of an analogue of the spider silk protein spidrolne major 1. The protein improves the moisturizing/ softening action of the compositions. The protein, and its fragments are used in cosmetic or dermatological compositions. These compositions have use as hair or skin care products; and make up or sunscreens. As the protein is a good, persistent film-formers on the skin of low surface density, it can be used for delivery of active agents that are generally difficult to administer, e.g. vitamins, hormones, moisturizers or agents for treating disorders of the skin and hair.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Spider silk protein; spidroine major 1; cosmetic; make-up; dermatological compositions; hair care; skin care; sunscreen; hormone; moisturizer; skin disorder; skin disorder.

The protein improves the moisturizing/softening action of the compositions. The protein, and its fragments are used in cosmetic or dermatological compositions. These compositions have use as hair or skin care products; and make-up or sunscreens. As the protein is a good, persistent film-formers on the skin of low surface density, it can be used for delivery of active agents that are generally difficult to administer, e.g. vitamins, hormones, moisturizers or agents for treating disorders of the

                                                                                                                                                                             This sequence represents the product of cDNA clone, pMTSS1, encoding the orb web spider minor ampullate silk protein MiSP1 has been identified and sequenced. Repeat unit peptides of MiSP1 may form part of a larger polypeptide with an amino terminus (see AAR80184-85) and a carboxy terminus (see AAR80186-89). Repeat unit peptides make up spider silk proteins (spidroins) which in turn aggregate to form the silk fibres. Spider silk fibres have high tensile strength and significant elasticity. An isolated cDNA clone of a silk protein encoding sequence is of use to produce the protein at high yields using recombinant DNA technology.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 2; Fig 1; 86pp; English.

EBNA 1 protein is used to stably maintain episomes containing EBV origin of replication (orip) and a gene encoding protein or RNA of interest. Eucaryotic host cells expressing EBNA 1 protein are transfected with the episomes to produce recombinant cell lines expressing multiple genes of interest. This provides a rapid and reliable method of stably expressing multiple genes in transfected cells. The episomes are useful in the transfection of genes encoding receptors, transporter proteins, ion channels, adhesion molecules and transcription factors. The episomes carrying desired genes can also be used to transfect cells in gene therapy, antisense therapy,
Stably transfecting eukaryotic cells with at least one episome

factors, such as antibiotics.

```
first and second proteins and the selectable marker are expressed, cand the selective pressure specified by the marker is maintained. Under these conditions, only cells containing both episomes live. Preferably, EBNAI is expressed from 1 of the episomes, and the protein of interest from the other episome. Either or both epitopes may further comprise a nucleic acid sequence encoding a protein desired to be expressed in the cell (e.g. a therapeutic protein), a nucleic acid encoding an RNA that is not intended to be translated (e.g. a therapeutic RNA), or a DNA sequence used as a tag for the cells. The method is applicable to cell culture or intact organisms, for gene therapy. It allows the rapid establishment of eukaryotic cells that stably and reliably express a gene of interest, using a novel method of selection, and maintenance of that selection without the need for exogenous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is that of DNA encoding the Epstein-Barr virus (EBV) nuclear antigen protein 1 (EBNA1). EBNA1 is utilised in a novel method for obtaining a eukaryotic cell that is stably transfected with at least one episome. This method involves transfecting a eukaryotic cell with: (1) a first episome comprising an EBV origin of replication (orig. see AAA50253), a gene encoding a first protein whose expression results in cell death and a selectable marker for eukaryotic cells; and (2) a second episome comprising an EBV orip and a gene encoding a second protein, where expression of the second protein prohibits the occurrence of cell death resulting from expression of the first protein to produce death resulting from expression of the first protein to produce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        doubly transfected cells which also express an antigen that promotes retention of the episomes by the cells. The double
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   production of a desired protein in vitro and for gene therapy

      Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
